Washington State Jails Coronavirus Management Suggestions in 3 “Buckets”

Publication date: March 5, 2020

Written by:
Marc F. Stern, MD, MPH
Affiliate Assistant Professor, School of Public Health, University of Washington, Seattle mfs@uw.edu

Acknowledgments:
I would like to express my gratitude to the following professionals for their invaluable (and rapid!) input: Lara Strick, MD, MS, Chief of Infectious Diseases at the Washington State Department of Corrections; Dr. Benjamin Sanders, MD, MPH, Medical Director at the King County Jail, Seattle; Rachel Wood, MD, MPH, Health Officer for Lewis County, WA; and John McGrath, Jail Services Liaison, WASPC.

The following ideas are provided as suggestions to jails for managing the impacts of COVID-19. It is VERY important to note that they are not standards or rules and also that many of these suggestions are based on current CDC recommendations. Therefore, jail administrators should heed the following three cautions. First, CDC recommendations regarding COVID-19 are changing constantly as more is learned about the virus, its spread, and its management. So check the CDC website (https://www.cdc.gov/coronavirus/2019-nCoV/summary.html) on a regular basis for changes. Second, local public health departments – the WA DOH (https://www.doh.wa.gov/Emergencies/Coronavirus), but especially county, city, and tribal health departments – are excellent sources of information. They may also make recommendations that differ from, or go beyond, CDC recommendations, based on local conditions and local resources. In addition, local public health departments are vested with certain legal authorities that may help you “make things happen.” So you should be in close contact with your local public health department. Third, your jail medical director has ultimate clinical responsibility for the health of inmates in your custody and may recommend different or additional steps based on your particular jail’s needs.

An additional resource that has been developed specifically for corrections is a slide set produced by Dr. Anne Spaulding at Emory University under a CDC grant. The current slide set will be sent with this document. However, it is being updated on a regular basis, so it’s best to check for the latest version at: https://accpmed.org/online_learning.php.
Bucket 1: Dealing with the effects of COVID-19 in the community

1. Disaster plan
Review, update, and start working with your disaster preparedness plan.

2. Supply chain
Among other things in the disaster plan, think about what are all the materials, supplies, equipment upon which you are dependent (i.e. items that would be affected by disruptions in your supply chain), and what are alternative sources. An important – if not most important – supply is food.

3. Screening staff
Consider screening staff reporting to work. For the moment those guidelines are: check for fever over 100 degrees, cough, shortness of breath, recent travel to a high-risk country, exposure to someone who is symptomatic and under surveillance for COVID-19. If 2 out of 3 are present, send them home. (You’ll want a simple form or log. You’ll also need a thermometer.) However, these guidelines may change as we learn more, so check the current CDC guidelines (https://www.cdc.gov/coronavirus/2019-nCoV/summary.html), but more importantly, be sure you’re getting the most recent guidelines from your local health department.

4. Screening arrestees
See the suggestions above for staff screening, with the obvious modification that someone who has a positive screen will not be sent home. Instead, first have the individual place a surgical mask on themselves and place them in isolation (a single room with a closed door in Booking, for example). Then the jail’s medical authority should be contacted for further management instructions.

5. Discouraging “presenteeism”
While we worry about absenteeism among staff, another concern is the opposite: presenteeism, which is staff coming to work despite being ill. They pose a risk to other staff and inmates. Explain the risk to staff and encourage them to stay home if they are ill. Depending on your own particular staff and staffing situation, you MAY want to consider an untested approach: for staff who have no sick or vacation days left, consider allowing staff to stay home penalty-free. On the flip side, to encourage healthy employees to continue to come to work, you might also consider liberalizing restrictions on overtime.

6. Non-contact visitation
If you don’t already have non-contact visitation, consider how you might do this, using either non-contact rooms or video conferencing. Phone visitation is another option.

7. Stay connected with the Health Department
Both we in jails, as well as public health officials, sometimes forget that county, city, and tribal jails are key parts of public health. Contact your local public health officer and ask that a jail representative be “at the table” both for planning meetings as well as when information is being shared with hospitals, nursing homes, and other parts of the public health system. Even though CDC is issuing up-to-date scientific guidance, it is the responsibility of the local health officer to interpret and implement that guidance. This officer, or delegate, is the person, for example, who would suggest/direct an at-risk staff member to self-quarantine.

8. Perform routine environmental cleaning
See the CDC website above for more detail, but in brief, continue to perform routine cleaning of all frequently touched surfaces. The normal disinfectants that you use are adequate. For infection control (and to help reduce fears among inmates), adopt a liberal approach to inmates who want to disinfect
their houses.

9. Routine steps to prevent spread of respiratory infections
Aside from environmental cleaning, follow CDC and any local health department recommendations for the usual personal steps to avoid spread of respiratory droplet-borne infections, including hand washing (a good short video from CDC: https://youtu.be/eZw4Ga3ig3E), sneezing or coughing into one’s elbow, not touching one’s eyes, nose or mouth with unwashed hands, and discarding tissues after using and washing hands. As simple as it sounds, hand washing is the most important protection. And wearing gloves does not eliminate the need to wash your hands. Make adherence to good hygiene easy for staff and inmates. Keep supplies, such as soap and paper towel dispensers and hand sanitizer full and available. Allow staff to carry personal-sized containers of hand sanitizer. It is appropriate to wear masks in certain situations (see below), but they are not recommended for routine use (and may actually increase risk). Remove barriers to good infection control for inmates. For example, inmates should have an ample supply of soap.

Bucket 2: Dealing with the effects of COVID-19 among staff
1. Downsizing
Talk with prosecutors and judges ahead of time to develop a plan if you need to downsize.
   a. Are there people you can release on their own recognizance? Do you have a priority list (who do you release if you need to downsize by 5%? 10%? etc.)?
   b. Are there alternatives to arrest for certain crimes, or, in dire situations, are there crimes for which your patrol division will not arrest?

2. Supplemental staff
Think about where could you might get supplementary staff. Retirees? Patrol?

3. Inmate activities and movement
What activities/programs can you curtail or cut?

4. Influenza
In the present environment, it’s hard to imagine this, but the flu remains a greater threat to community (and jail) health today than COVID-19. As of the week ending February 22, CDC lists Washington State (and 38 other states) as having flu activity in the highest of the high category. So far this season, in our state alone, there have been 74 deaths from the flu (and 18,000 deaths nation-wide). And flu vaccination is very safe and very effective in preventing or attenuating the current strains of influenza virus going around. Staff who have not yet been vaccinated against the flu should be encouraged to do so. The better protected your staff is, the less likely you are to have absences from at least one infection, and it will help avoid confusion and panic that someone has COVID-19 infection. If it will help encourage vaccination, consider arranging with a local pharmacy to offer the vaccine on-site at no charge (actually, if employees have insurance, it may very well be covered).

Bucket 3: Dealing with infection, or possible infection, among inmates
1. Influenza
Offer and administer flu vaccine to all eligible inmates who have not been vaccinated. No, flu vaccine does NOT protect against Coronavirus. However, it still makes sense to vaccinate inmates for the same reasons that staff should be vaccinated. Also, given the high risk of influenza, vaccinating inmates will decrease the possibility of overloading your jail health care system with severe respiratory illness from a highly preventable cause.
2. Inmates who want to go to medical
When a patient requests to see a medical professional for a respiratory complaint, before bringing them to the medical unit, the deputy should have the patient put on a mask. A simple surgical mask is adequate.

3. Masks
For the moment CDC recommends simple surgical masks for symptomatic patients, and higher efficiency masks for health care workers who are working in close proximity (within 6 feet) of a patient with possible COVID-19. Because, in jails, custody staff working with persons with possible COVID-19 infection share many of the same tasks and exposures as health care workers in the community, it would make sense for custody staff to use the same personal protection as jail medical staff who are working in close proximity of patients. For the moment, this recommendation is to use N-95 masks. In case you have trouble getting N-95 masks, you can use any mask with an N, P, or R letter designation and a 95 or 100 number designation. And if none of these masks is available, use simple surgical masks. As an example of adjusting to shortages of N-95s, King County Jail is moving towards only allocating these masks to health care workers who have close contact (e.g. physical examination, obtaining laboratory samples) with patients with possible COVID-19 infection.

4. Other Personal Protective Equipment (PPE)
For the same reasons as described above, it would be wise for custody staff to follow the same general guidelines for PPE as jail medical staff. You should review the recommendations on the CDC website. There is more detail there than we can provide here...and it may change. The recommended PPE also depends on the patient and the task your staff is performing. For example, at one end of the extreme, if staff are going to be in a “hands-on” situation with a person who has obvious secretions, more protection will be needed, while at the other end of spectrum, if the patient is cooperative, with no secretions, and the contact will be brief and at a distance of over 6 feet, less protection will be needed. Generally, in addition to a mask with eye protection, CDC is recommending staff use Standard Precautions, including gloves.

5. Isolation
For patients who meet the CDC’s current recommended criteria for isolation, CDC also currently recommends they be placed in negative pressure rooms. This will be a tall order for many jails. And even for jails equipped with negative pressure rooms, demand may exceed supply. Therefore this is one of the many topics you should be discussing with your local public health authority ahead of time, to seek their advice and their help in developing a plan in coordination with community resources (especially the hospitals). They may recommend alternative solutions, such as keeping certain patients isolated in their own cell with the door closed. You should also do what you can to not make placement in isolation feel punitive. Inmates in isolation should have ample access to comfort, entertainment, and activity-related materials allowed by their custody level. An important reason for this suggestion is that you want to do everything possible to encourage inmates to notify medical staff as early as possible if they experience symptoms of infection. Fear of being placed in an overly-restrictive cell may delay their notification, which is counterproductive.
